Finding the principle quantum number, which represents the size of the orbital, is easy. For a $2s$ or $2p$ orbital, it would be 2 , for a $4s, 4p$ or $4d$ orbital it would be 4 , etc. In this case, the correct answer is 3 (for $3p$). Finding the azimuthal quantum number is slightly more difficult.

The first quantum number describes the electron shell, or energy level, of an atom. The value of n ranges from 1 to the shell containing the outermost electron of that atom. For example, in caesium (Cs), the outermost valence electron is in the shell with energy level 6 , so an electron in caesium can have an n value from 1 to 6 .

Describe the properties of an electron associated with each of the following four quantum numbers: n , l , m_l , and m_s . Answer. n determines the general range for the value of energy and the probable distances that the electron can be from the nucleus. l determines the shape of the orbital. m_l determines the orientation of the orbitals of the same l value with respect to one another. m_s determines the spin of an electron.
