~~Anatomy of Monocot Leaves | Botany~~

Monocot flowers most often have the parts in sets of three, occasionally four, but almost never five. The numbers are especially characteristic of the sepals and petals. The stamens and pistils may be numerous even when the perianth is trimerous (in sets of three), or the single ovary may have only two carpels instead of three. Often there are six stamens, representing two whorls of three.

~~Monocotyledon | plant | Britannica~~

The first volume of the Anatomy of the Monocotyledons from the Jodrell Laboratory, Kew, dealt solely with the Gramineae and was published last year [XXXI, 2838]. Like the preceding volume, the present one is also concerned with a single family, the Palmae, a family, like the Gramineae, of major... Anatomy of the monocotyledons.

~~Anatomy of the monocotyledons. II. Palmae.~~

Monocot apomorphies (characteristics derived during radiation rather than inherited from an ancestral form) include herbaceous habit, leaves with parallel venation and sheathed base, an embryo with a single cotyledon, an atactostele, numerous adventitious roots, sympodial growth, and trimerous (3 parts per whorl) flowers that are pentacyclic (5 whorled) with 3 sepals, 3 petals, 2 whorls of 3 stamens each, and 3 carpels.

~~Monocotyledon - Wikipedia~~

Monocot Plant leaves have a parallel venation system. Bulliform cells are found in the monocot leaves which are developed from the veins and adaxial epidermal cells. In the mesophyll, no differentiation is found between the palisade and spongy parenchyma.

~~Monocot and Dicot Plant Anatomy - Introduction, Definition ...~~

Anatomy of primary monocot stem. Monocot stem has only the primary structure. The ground tissue components are not differentiated, and the vascular bundles are scattered. The layers from outside to inside are; epidermis, hypodermis, ground tissue, and vascular strand.
Epidermis
